Econometrics Report

Facts

- Model: cs_did
- y = outcome; X = policy_intensity
- Rows used: 120 · Columns: 5
- Dataset kind: panel
- Variables dropped from model: policy_intensity (dropped due to perfect collinearity)
- Note: variable importance is based on marginal (univariate) association with the outcome and may differ from multiva

Descriptive statistics

- state (str): missing=0 unique=12
- year (int64): mean=2014.5000 std=2.8843 min=2010.0000 max=2019.0000 missing=0 unique=10
- first_treated_year (int64): mean=1511.2500 std=876.1801 min=0.0000 max=2017.0000 missing=0 unique=4
- policy_intensity (float64): mean=1.3330 std=0.5461 min=0.7600 max=2.4020 missing=0 unique=12
- outcome (float64): mean=6.1588 std=1.8387 min=3.1980 max=10.9980 missing=0 unique=118

Interpretation

- In cs_did_1, holding other selected regressors constant, each one-unit increase in ATT is associated with an average
- Variable 'policy_intensity' was dropped due to perfect collinearity. [source: diagnostics.warnings] [confidence: 1.0]

Statistical tests (outcome-related)

- ANOVA: outcome by policy_intensity: Statistic 8.4711; p < 0.001. [source: statistical_tests.anova.outcome.policy_inte
- Kruskal-Wallis: outcome by policy_intensity: Statistic 55.1133; p < 0.001. [source: statistical_tests.nonparametric.krus
- Pearson correlation: outcome vs policy_intensity: Statistic 0.1636; p = 0.074. [source: statistical_tests.correlations.ou
- Kendall correlation: outcome vs policy_intensity: Statistic 0.0761; p = 0.235. [source: statistical_tests.rank_correlation
- Spearman correlation: outcome vs policy_intensity: Statistic 0.1013; p = 0.271. [source: statistical_tests.rank_correlat

Warnings

- Variable 'policy_intensity' was dropped due to perfect collinearity.
- Dataset detected as panel-like, but this run used a pooled cs_did model without fixed effects or clustered standard er
